

GLOWING GHOST ECTOPLASM

INNOVATION WYRKSHOP

INNOVATE HER

CLUB

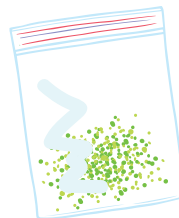

MATERIALS PROVIDED

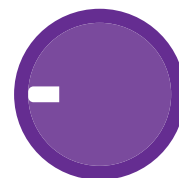

bottle of questionable materials

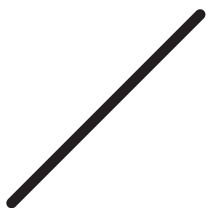

ghost residue

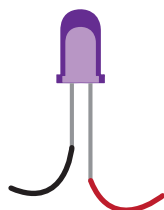

unknown particles from area 51

bottle base

plastic stir stick

pre-wired UV LED

electrical tape

3V coin cell battery

MATERIALS NEEDED

about 1 cup of water

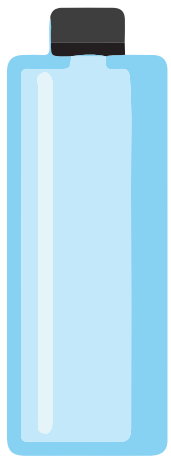

STEP 1:

Mix together the unknown particles gathered from Area 51 and the ghost residue with the plastic stir stick provided.

STEP 2:

Fill up your bottle of questionable materials with water. Make sure to fill it almost all the way to the top. It should be just about where the bottom of the lid is.

*fill with water
to about here*

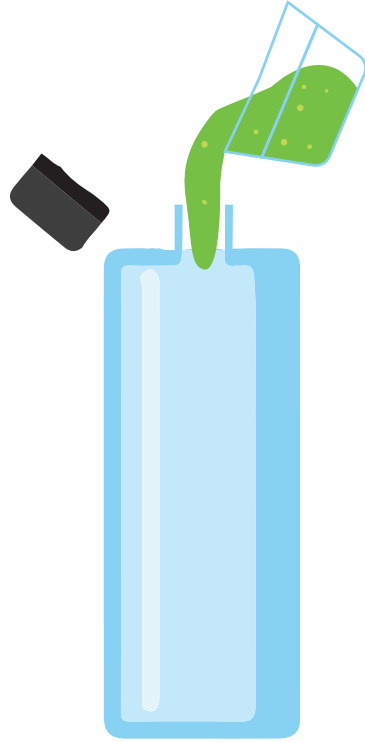

**Observation
Opportunity!**

*What happens to the
materials when you fill
the jar with water?*

STEP 3:

3:

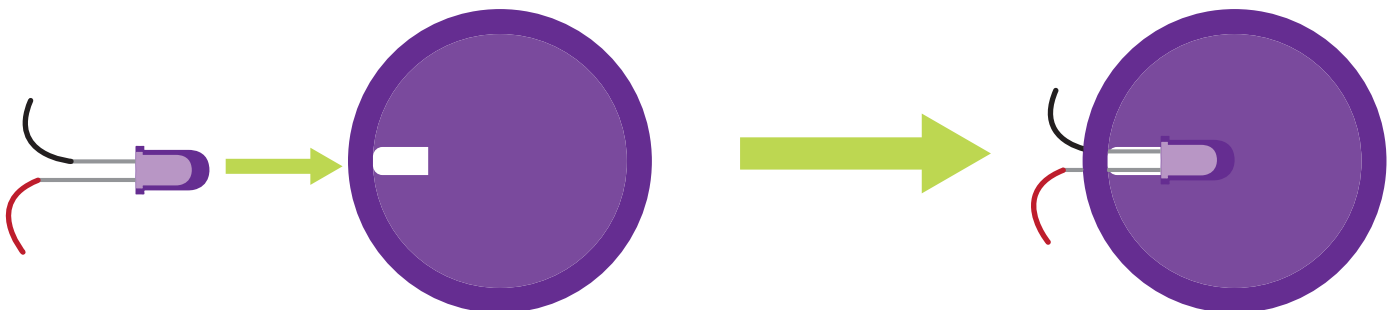

Pour your mixture from Step 1 into your jar of questionable materials and water. What happens here is pretty cool so watch closely!

STEP 4:

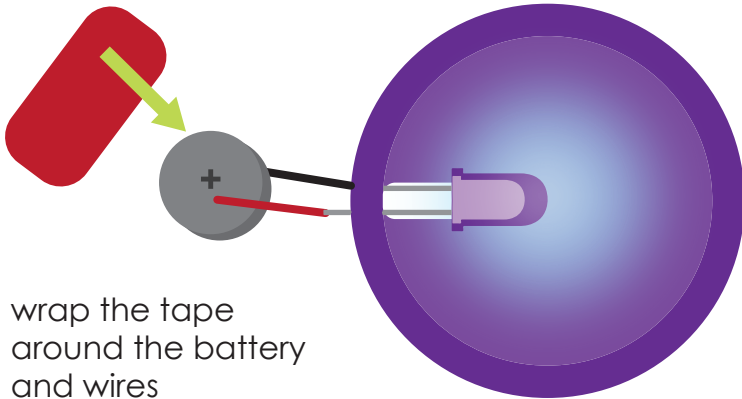

4:

Make your base for your jar! Insert the LED into the slot in the base. You can tape in place if you would like but it's not necessary.

STEP 5:

Now it's time to connect the battery! Make sure the red wire is touching the positive side of the battery and the black wire is touching the negative side. Use the strip of electrical tape to secure the wires to the battery.

With wire it's common practice to have red wire be the positive connection and black wire be the negative connection. This is also called power (positive) and ground (negative).

STEP 6:

Time for the spooky part! With your battery secured, place your base on a flat surface, then place your jar on top of your base. The next thing is to turn off the lights (or move into a darker environment)!

WHAT CREEPY CREATION HAVE YOU UNLEASHED!!!
